Functional Requirements:

- As a player, I can choose a token(X or O) that will decide whether I go first or second.
- As a player, I can place a token in any open spot so that I can try to get 5 in a row to win.
- As a player, I can reselect a different spot if the spot I chose already contains a token.
- As a player, I can reselect a different spot if I choose an invalid position.
- As a player, I can choose to play again when the game ends so that I do not have to re-run the program.
- As a player, I can win by getting a set number of my markers in a horizontal row.
- As a player, I can win by getting a set number of my markers in a vertical row.
- As a player, I can win by getting a set number of my markers in a diagonal row.
- As a player, only I or my opponent can win.(Only one of us can win)
- As a player, after I go, it is the next player in the rotations turn to go.
- As a player, if all the spots on the board are taken, and there is still no win, it is a draw.
- As a player, I can choose any character to represent my player.
- As a player, I can set the side of the board, ranging from 3x3 to 100x100.
- As a player, I can set the number of tokens I need in a row to win, ranging from 3 to 25.
- As a player, I can choose whether or not I want my game to be memory efficient.

Non-Functional Requirements:

- Must be written in Java
- Must run in UNIX/ Linux based OS
- Gameboard is of size 5 x 8
- 0,0 is the top left of the board

Makefile Instructions:

- “make” to compile
- “make run” to run
- “make clean” to clear the .class files

Testing:

GameBoard(int r, int c, int w)

Input r = 32 c = 25 w = 13 board doesn't exist yet	Board is initialized with a row value of 32 a column value of 25 and a numtoWin value of 13. All positions are set equal to ' '.	This is a normal run of the constructor with effectively random values.
--	--	---

GameBoard(int r, int c, int w)

<p>Input</p> <p>r = 3</p> <p>c = 3</p> <p>w = 3</p> <p>board doesn't exist yet</p>	<p>Board is initialized with a row value of 3 a column value of 3 and a numtoWin value of 3. All positions are set equal to ' '.</p> <p>(numToWin = 3)</p> <table><tr><td></td><td>0</td><td>1</td><td>2</td></tr><tr><td>0</td><td></td><td></td><td></td></tr><tr><td>1</td><td></td><td></td><td></td></tr><tr><td>2</td><td></td><td></td><td></td></tr></table>		0	1	2	0				1				2				<p>This test case is unique because it tests with the minimum values according to the invariants.</p>
